

ExitDrill

A fire drill for your DeFi exit

Rehearse a vault withdrawal. Keep the evidence.
Recheck through a local kit when the website is gone.

The withdrawal problem

A vault balance does not tell you whether your exact withdrawal will execute.

Limits, contract changes, gas, and unavailable interfaces can interrupt an exit. A saved transaction alone can become stale.

ExitDrill targets direct ERC-4626 redemption by the owner.
It does not recover keys or bypass contract restrictions.

A rehearsal with a receipt

- 01 Inspect a pinned source block
- 02 Reconstruct the exact redeem call
- 03 Execute inside a private Anvil fork
- 04 Check event, balances, and supply

PASS, BLOCKED, or UNKNOWN stays attached to its evidence and limitations.

LOCAL FIXTURE

19/09/2028, 16:33:48

✓ PASS · FORK EXECUTED

Rehearsal succeeded.
The exact redemption executed and its share, asset, supply, and withdrawal-event checks passed.

Shares tested	Assets received in rehearsal
250 tSHARE	250 tDAI

Estimated output before execution: 250 tDAI. Original gas assessment: sufficient.

What was checked

#1 Validate position

#2 Prepare isolated fork

#3 Execute exact redemption

#4 Verify balances and event

#5 Evidence complete

► Inspect the evidence

Blocks, transaction, balances & assumptions ↗

Ethereum evidence

1 sDAI $\rightarrow$ 1.180713732702892348 DAI

Executed inside a private fork at source block 26,010,689.
Receipt, Withdrawal event, share burn, asset increase, and total supply checks passed.

Compiled pinned SavingsDai source with solc 0.8.17 and compared deployed executable bytes and immutables.

Historical experiment only. No mainnet transaction. Live adapter awaits repeat validation.

The kit survives a hosting outage

A ZIP contains the interface, exit plan, evidence, launcher, and file checksums.

Saved evidence opens offline. Fresh checks use your own RPC connection. No npm install or hosted ExitDrill API is required.

Verified with the local web and API services stopped.
Wallet-extension testing remains open.

Prototype and next steps

Working today

Four live vault cases
Exact bigint amounts and calldata
34 automated tests
Standalone kit and public demo

Next release gates

Reliable second-RPC repeat run
Injected-wallet demonstration
Latency and accessibility audit
User comprehension testing

Next.js · TypeScript · Viem · Fastify · SQLite · Anvil · OpenZeppelin
Public demo: [jhahimanshu653--exitdrill-web.modal.run](#)
